

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	28 September 2026
Team ID	
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization

Brainstorming provides a free and open environment for the team to generate different solutions to the identified customer problem. Ideas are first generated without judging them and are then grouped and prioritized based on their importance and feasibility.

For this project, the brainstorming focuses on improving the way employees request network services and how IT teams handle approvals, routing, fulfillment, communication, and tracking.

Selected Problem Statement

Employees need a simple and transparent way to request network services through ServiceNow, but varying information requirements, multiple approval steps, and limited status visibility can make the process confusing and time-consuming.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

The team discusses the customer problem from the employee and IT team's perspective and agrees on the main problem to solve.

Customer	Employee / IT service requester
Main Need	Request network access quickly and securely
Current Difficulty	Unclear information requirements, approvals and request status
IT Challenge	Manual coordination, routing and follow-up
Selected Problem	Create an automated, transparent and standardized network request process in ServiceNow

Step-2: Brainstorm, Idea Listing and Grouping

Idea Group	Brainstormed Ideas
Form & User Experience	• Dynamic request form that shows only relevant fields • Simple request-type selection: VPN, Wi-Fi, IP Whitelisting, Firewall • Mandatory-field validation to reduce incomplete requests • Clear help text and examples for technical fields
Approval & Security	• Automatic manager approval • Additional security approval for IP Whitelisting and Firewall requests • Approval status tracking • Approval history for audit purposes
Routing & Fulfillment	• Automatic routing to Network Support • Separate routing for Network Security requests • Standardized fulfillment stages • SLA-based tracking and escalation
Communication & Tracking	• Automatic submission notification • Approval/rejection email notifications • Request status updates • Requester notification when access is fulfilled
Monitoring & Audit	• Central request dashboard • Audit trail of approvals and changes • Reports on request volume and processing time • Visibility into pending and completed requests
Future Enhancements	• Knowledge suggestions while filling the request • Self-service request status dashboard • Automated reminders for pending approvals • Analytics for identifying recurring request delays

Step-3: Idea Prioritization

Prioritization Matrix

Importance \ Feasibility	Low	Medium	High	Priority Area
High	• Advanced analytics	• Approval status tracking • Audit history • SLA tracking	• Dynamic request form • Automated manager approval • Security approval routing • Automatic Network Support routing • Email/status notifications	High-importance ideas
Medium	• Predictive analytics	• Automated reminders • Reporting dashboard	• Help text and field guidance • Request status dashboard	Medium-importance ideas
Low	• Complex future integrations	• Additional self-service enhancements	• Knowledge suggestions	Lower-priority ideas
	Low feasibility	Medium feasibility	High feasibility	

Prioritized Ideas for the Project

Priority	Idea	Why it matters	Implementation Focus
1	Dynamic request form	Reduces confusion and incomplete submissions	Catalog variables + UI Policies
2	Automated manager approval	Reduces manual coordination and approval delays	Flow Designer
3	Security approval for sensitive requests	Adds control for IP and Firewall access	Conditional Flow Logic
4	Automatic Network Support routing	Sends approved requests to the right team	Assignment / Flow
5	Notifications and status tracking	Keeps the requester informed	Flow notifications
6	Audit history and reporting	Improves visibility and accountability	ServiceNow records/reports

Selected Concept

The selected concept is an automated ServiceNow workflow that combines a dynamic network service request form, conditional manager and security approvals, automatic routing to the appropriate network team, notifications, and request tracking. This directly addresses the identified customer problem while remaining practical to implement using ServiceNow.
